daily_products

Schema: exp_prod | **Grain:** subsession x product | **Refresh:** Daily | **Family:** Session-level summary datasets

What this table is

Extends daily_sessions by adding product-level context so each row represents a subsession x product combination. Enables product, taxonomy, and order line-level analysis. Source table for fanstreams_web_data_v2 in Tableau (NA only — FI has its own copy of the same data). Contains all daily_sessions fields plus product identifiers, taxonomy (department, league, team), product attributes, and order line metrics.

Key columns

Column	Type	Why it matters
product_id	int64	Product identifier. Grain key alongside session fields from daily_sessions.
order_ref_num	string	the order_ref_num of this subsession - note that this is constant for the entire subsession. even products that were only viewed in a subsession with an order (but not purchased themselves) will have this id. use `has_thku_page` to disambiguate.

has_thku_page	boolean	was this product id seen on the THKU page - was it in a placed order?
department_name / sub_department_name	string	Friendly department/sub-department. Use for product taxonomy analysis.
league / team_scd / player_scd	string	League, team, and player associated with the product. SCD suffix = from slowly changing dimension snapshot.
custom	boolean	True if the product is customized/personalized (e.g. MTO jerseys).
isdropship	boolean	True if fulfilled via drop-ship. Relevant for delivery and margin analysis.
op_net_demand / op_gross_demand	double	Net and gross demand at order-line level. Use op_net_demand for revenue metrics.
op_contribution_margin	double	Contribution margin at order-line level.
derived_exclusions	string	Reporting exclusion category (e.g. 'Soft Exclusion'). Filter out excluded products for clean revenue reporting.

Known caveats

- Fanstreams_web_data_v2 in Tableau is North American only — FI has a separate copy for international markets.
- op_ columns (order product metrics) will be null for sessions without an associated order — left join behaviour.
- SCD columns (_scd suffix) reflect the product attributes at the time of the snapshot, not necessarily at time of order.
- derived_exclusions and derivedexclusions are duplicate fields with different naming — use derived_exclusions.

Used by

- Session-level summary datasets
- Tableau fanstreams_web_data_v2 (NA only)
